DIP in context

Documents: archives, newspapers, magazines, books, letters, engineering drawings, diagrams, maps, bank checks, sheet music,

Goal of DIP depends on document type

Document type

DIP Target

plain text illustrated text structured text envelope, letter directory, TOC business form schematic diagram engineering drawing map music score table

correct word order for OCR reading order, links to illustrations compilable or executable form routing information name-attribute pairs links to database, add tags net list or graph current CAD format **GIS** representation **MIDI** representation layout-independent descriptor

Caveat Emptor: DIP now largely retrospective

- Most documents we wish to keep now produced digitally: books, journals, newspapers, letters, drawings, forms (like tax returns and Indian visa applications). But ...
- Digital version is not always available \rightarrow personal DIA.
- Original software or digital medium is not always available:
 → conversion of CAD drawings, tech journals, census data.
- Many pre-1980 documents remain to be converted, some of business value (utility drawings, cadastres), and many historical artifacts.
- In the US, there is continuing interest in security applications.

OUTLINE

- The evolution of documents
- Advances in document image capture
- Document image analysis
- Challenges
- To read further

Conclusions

Ancient manuscripts still require manual keying. Automated OCR of original plain text documents

in common scripts is usable for most purposes.

- Conversion of illustrated text, tables, graphs, requires interaction.
- Form recognition helped by context from database, but requires occasional intervention and confirmation. Better tools are needed.
- Ditto for line drawings and maps.
- We are about to witness the convergence of digital libraries and the semantic web.

OUTLINE

- The evolution of documents
- Advances in document image capture
- Document image analysis
- Challenges

Preservation

- In the last decade, tremendous *global* interest.
- Digitization for wide access (& sequestration of originals!)
- Requires non-contact imaging, and *fast,* interactive image enhancement, annotation, and indexing.

Large-scale conversion projects underway in many countries

Welcome to the compilation of <u>Sanskrit Documents</u> in Devanagari display and transliteration format. In addition to the sanskrit texts, you will find here various tools for learning <u>Sanskrit</u> such as the <u>Online Sanskrit Dictionary</u>, <u>Sanskrit Tutorials</u>, <u>Sanskrit Pronunciation guides</u>, and software for <u>learning Sanskrit and producing documents in Devanagari & Roman formats</u>, and much more. You can generate display in Devanagari or other scripts using the <u>web-interface</u>.

We encourage you to *participate* in these efforts by reviewing, encoding, spreading the word, and implementing available resources to make *Sanskrit* learning easier. Answers to frequently asked questions are given in <u>FAQ</u>. A live Sanskrit links page is maintained at <u>sanskritlinks</u>. We need volunteers to proofread the texts available in pending sections 1, 2, and 3.

Join the email-based lively discussions in the <u>Sanskrit Mailing List</u> or Sanskrit digest for discussions on the Sanskrit language and literature. Mails are archived, but you have to subscribe to browse them.

For scholarly promotion of Sanskrit literature studies, we have also compiled a long list of <u>Sanskrit documents available elsewhere</u>, <u>hundreds</u> of <u>scanned books</u>, and <u>audio files</u> on the internet.

Visit the non-profit sites such as Complete Narayaneeyam, Surasa.net, and SETU hosted on this site.

Please fill in our GuestBook/Feedback and browse through the Site using the Site Contents Map or the navigation bars on top and bottom.

15th-20th C: Printed Documents

Documents contain symbols.

They require different techniques from natural pictures (photos).

Documents, intended for ease of human reading, have high contrast (→ bilevel or decomposable into bilevel layers); isothetic (rectilinear) layout; limited (domain-specific) symbol vocabulary; significant language and application context; isogeny (common source) wrt author, printer, copier, scanner.

Most DIP applications are batch oriented: they require fast, repetitive processing of similar images.

Large-scale DIA applications

- **Post** (email, courier, barcode, RFID?)
- Bank checks ↓ (electronic fund transfer)
- **Forms** \downarrow (direct data entry through web forms)
- Patents, technical journals ↓ (nearly done)
- Books ↑ (© ?)
- Engineering Drawings ↓(now mainly utilities)
- Maps ↓ (satellite remote sensing, GPS)

21st C: Electronic Documents

- PDF files (based on compressed Postscript) (often easier to analyze after rendering!
- HTML files

tags often used in arbitrary ways: e.g., for layout

- XML tags require Document Type Definition
- Nested pages are troublesome (Document Object Model)
- Dynamic documents!

Syntax → Semantics

 Domain-specific ontologies for the semantic web Dublin Core Metadata Resource Description Framework OWL Web Ontology Language

knife-edge for measuring psf

IEEE Computer, 1983

Indian scanner pioneer

Dr. Deekshatulu was a Visiting Scientist at the **IBM Watson Research Centre, York Town** Heights, New York, and at the Environment **Research Institute of Michigan during 1971-72** on Digital Image Processing and Remote Sensing. He designed and fabricated for the first time in India, Grey scale and color Drum Scanners for computer picture processing which won him an NRDC Award.

6/5/2008

Scan Mechanisms

Flying spot:

Scan: LEDs (CRT obsolete)

Photometric scanner controls

R (0-100%) or OD (0-2.0)

+ dpi, format

Important Scanner parameters

- •Point spread function (PSF) diameter and shape
- •Spatial sampling rate (nominal / physical)
- •Photometric transfer function (reflection density to gray levels)
- •Photometric uniformity across the page
- Horizontal vs. vertical, and left vs. right uniformity
 Geometric linearity
- •Color response (for mans, dron-out fo
- •Color response (for maps, drop-out forms, magazines)
- •Repeatability (temperature, aging light, scan start/stop)
- •Cosmetic functions (crop, straighten)
- •Document format support (including compression)
- •Speed and data transfer rate (simplex/duplex)
- Digitally stored scan parameters
- •Support for calibration

Calibration

Compensates for Non-uniform illumination (variation usually smooth) Non-uniform sensor sensitivity (row or array sensors) Geometric distortion (including page transport if any)

Can be done within or outside the device Test targets should be scanned with every batch

Test Charts

6/5/2008

CALIBRATION CHART

gray scale spatial sampling resolution geometric linearity

Modulation Transfer Function (MTF) (sometimes sinusoidal rather than bar patterns are used)

- Modulation = (Max Min) / (Max + Min)
- MTF is the ratio of the modulation to the modulation at f=0 lpm or cpm as a function of spatial frequency.
- Horizontal and vertical MTF are measured separately.
- The limiting resolution is the lpm where the modulation is 5% of the maximum modulation.
 6/5/2008 SSDIP, GN, Bangalore

OTF, MTF (=SRF), PSF

The optical transfer function is the Fourier Transform of the point spread function.

The real component (modulus) of the OTF is the MTF; its phase is the PTF.

OTF(fx, fy) = MTF(fx,fy) * PTF(fx,fy), where fx, fy the are spatial angular frequencies.

The ideal MTF is the Fourier Transform of a delta function.

SSDIP, GN, Bangalore

Acronymous Quantitative Scanner/Camera Characterization

Progress in image digitization

Current status

- Normal reading material is digitized at 200-400 dpi.
- There is a spatial sampling rate / gray-scale trade-off, but most OCR software is still bilevel.
- Equipment must be matched to document quality, but scanner cost is now longer a major factor.
- Consumer cameras match CCD scanner psf, and almost match geometric linearity.
- Cell-phone type cameras will soon offer ubiquitous document digitization.
- Most applications require human oversight of digitization.

DOCUMENT PROCESSING DATA FLOW

6/5/2008

Bottom-up DIA

- Preprocessing (pixels)
- Glyph segmentation (primitives)
- Text recognition (OCR) (structures)
- Page layout analysis (document)
- Indexing and IR (corpus)

Preprocessing

- Recover scan parameters (dpi, psf, gamma, color)
- Recover batch application data
- Decompress (or analyze compressed representation)
- Filter noise (but keep periods and dots on the i and j!)
- Binarize (global / local / interactive) (??)
- Detect and remove (??) skew
- Character segmentation / line-art vectorization
- Script, orientation, language, font recognition

Preprocessing often removes useful information. Devise distortion-invariant analysis procedures instead!

C D
Skew detection & Character Segmentation

So may the The world In law, wh

from Cheriet et al

Glyph segmentation

- Projections
- Connected Component analysis
- Morphological operators (open, close)
- Templates

"Physical" layout analysis

- Assemble or subdivide rectangular regions
- X-Y trees (successive H & V cuts)
- DID (side-bearing model)
- Columns, paragraph blocks, illustration blocks, word blocks, character blocks (?)

Evaluation difficult without downstream processing!

Some examples of generic typesetting knowledge for text set in derivatives of the Latin alphabet:

- Printed lines are parallel and roughly horizontal.
- The baselines of characters are aligned.
- Each line of text is set in a single point-size.
- Ascenders, descenders, and capitals have consistent heights.
- Serifs are aligned.
- Typefaces (including variants italic or bold) don't change within words.
- Within a line of text, word spaces are larger than character spaces.
- The baselines of text in a paragraph are spaced uniformly.
- Each paragraph is left-justified or right-justified (or both), with special provisions for the first and last line of a paragraph.
- Paragraphs are separated by wider spaces than lines within a paragraph, or by indentation.
- Illustrations are confined to rectangular frames.
- In multi-column formats, the columns are of the same width. 6/5/2008 SSDIP, GN, Bangalore

Advanced Character Recognition 6610

(invited)

George Nagy

Rensselaer Polytechnic Institute, Troy, NY, USA

CATALOG DESCRIPTION

ECSE 6610 - Advanced Character Recognition. Principles and practice of the recognition of isolated or connected typeset, hand-printed, and cursive characters. Review of optical digitization, supervised and unsupervised estimation of classifier parameters, bias and variance. expectation maximization, the curse 0 dimensionality. classification Advanced

dimensionality. Advanced classification techniques including classifier combinations, support vector machines, hidden Markov methods, styles, language context, adaptation, segmentation-free classifiers, indirect symbolic correlation. Prereq: ECSE 2610, Probability, Linear Algebra, Spring term annually.

ECSE-6610 FIRST DAY HANDOUT

SYLLABUS

1. Review: Intro to OCR (ECSE 2610)

Preprocessing:

Scanner calibration, correction of scan distortions; noise removal; text-figure separation; skew correction; gray-scale and color, text layout extraction (column, line, and word segmentation) [NG 00]. Character image defect models [KBH 94] Recovery of scanner distortions [BE 00]. Help Session: Wed. 6 pm Prof. E. Barney Smith.

Features:

Reflectance, geometric, & topological invariants [FG 60, SM 61] Features as weak classifiers [KE 00] N-tuples and feature selectection [JN 95, JDM 00, JKNS 96]

Resource person: Dr. D-M Jung, Yahoo!

Static single-pattern classifiers:

Bayes: Single & Multimodal, Linear, Quadratic, Gaussian and Bilevel [DHS 01, LKF 01] Neural Networks: Backprop, LVQ, RBF [BC 95] Support Vector Machine [VV 98] Nearest Neighbors [DHS 01] Decision Trees and Forests [AGW 07, TH 98]

Classifer training:

Sample size and dimensionality [RJ 91] Bias and variance [GBD 92] Bagging, Boosting, Random Subspaces [JDM 00] Clustering [TK 99] Expectation Maximization [DLR 77, RW 84]

Reading order?

Holnap este talan hazajovok, de lehet, hogy nem tudok. Mikor vacsorazunk? Szeretnek enni egy burgonyat.

Miert akarod hogy okvetlenul jojjek? Talan lesz vendeg? Biztos sokaig tart. Elo kell nekem kesziteni ket kulombozo eloadast.

"Logical" layout analysis

Identify *domain-specific* components

e.g. title, author, affiliation, page number,... or wire, component, connector, label,... or destination name, street, number, city, county, ... or clef, note, duration mark, ...

- DID
- Page grammars

Some examples of publication-specific rules (for articles in IEEE –PAMI):

- Title-lines are set in 21/23-point roman bold.
- There are at most 4 lines in the title.
- Bylines follow the title and are separated by 17-point leading.
- Bylines are set in 10/12-point roman all-caps.
- Text paragraphs are indented, except the first, which begins with a 26-point drop-cap.
- The page numbers are set flush with the margin and alternate from left to right.
- Footnotes are set 6/7 point, numbered with leading superscripts, and separated from the narrative by at least 4-point leading. SSDIP, GN, Bangalore

DID

Gary Kopec and Phil Chou *Communication theory framework for document recognition*

$n_{I} \xrightarrow{(1,0)} t_{2}(.1) (0,B) \xrightarrow{t_{3}(.1)} (0,D) \xrightarrow{n_{1}} t_{3}(.1) \xrightarrow{n_{F}} n_{F}$ $t_{1} (.9] (0,1) \xrightarrow{t_{3}(.4] (1,0)} t_{4}(.6) (-1,0)$ $t_{4}(.4] (W_{3},0) \xrightarrow{n_{F}} t_{1} (.1/F)(W_{1},0)$ $\xrightarrow{n_{F}} t_{1} (.1/F)(W_{1},0)$

Document Image Decoding:

Whole page recognition with stochastic attributed context-free grammars.

Address Analysis

Job Title

nda bila

ALC: NO LOOP

IN SECTION.

Business Card Readers

Address Analysis

Logical Address Analysis

Wide variety of address block layout

Line-drawing and Map conversion

- Always interactive
- Layers sometimes available as hardcopy
- Auto-vectorization superimposed on bitmap
- Approved segments change color
- Label entry facilitated by grouping labels
- Loss of context (partial display) disorients
- Software costs vary over two orders of magnitude

Left mouse (+ SHIFT key) to draw rectangle, press CTRL down for distance.

(361.1502,283.3120)

Other DIP applications

- Document authentication: watermarks and (digital) signatures
- Duplicate detection
- Redaction r very
- Access control (CAPTCHAs)

- Text in photos and video
- Specialized scripts (music, chess, ...)

1.P-K4 P-K4 2.N-KB3 N-QB3 3.B-QN5 P-QR3 4.BxN

OUTLINE

- The evolution of documents
- Advances in document image capture
- Document image analysis
- Challenges (take the baton and run!)
- To read further

Tech-text

- Convert formulas and equations to executable form
- Tables: recover header to content-cell relations
- Illustrations: categorize (graph, photo, chart) and extract text for downstream use
- OCR: beyond within-class style
- Don't waste operator interventions!
- Web documents for stuffing databases: "curators" are expensive and have a limited attention span (e.g. biology, sociology, marketing, intelligence)

Bureaucratic forms

- Currently one-form at a time: should exploit information from forms processed earlier, and from forms arriving later!
- Accumulate layout/classification data from all processed forms, right or wrong: the current data stream is more representative than your training set.
- Don't waste operator interventions!

Historical documents

- Combine interactive processing with ground-truthing
- Scan it right the first time, and keep calibration information for reprocessing with future algorithms.
- Instead of attempting to clean up the document, seek distortion-invariant algorithms.
- Don't waste operator interventions!

Evaluation

- Evaluate intermediate stages, e.g., text/photo/line-art segmentation (pixel level? rectangles? overlaps? GT?
- Several orders of magnitude discrepancy between test data used for IR (e.g. TREC) and test data used for DIA (e.g. UW)
- Metrics for interactive processing (because it won't disappear anytime soon)
- Same metrics for semi-automated ground-truthing

Digital libraries

- Dual format?
- Links between image and text?
- More/different metadata? (glosses, translations)
- Interoperability?
- GUI (Google is often easier!)
- Selective access?
- On-line or automated reference librarians?
- Relations with monster publishers?
- Interface/merge with the semantic web?
- Perpetual exponential growth?

6/5/2008

SSDIP, GN, Bangalore

Summary

- Most new documents are computer produced: DIA may have already peaked.
- Digitization of hardcopy now essentially lossless.
- There are no universal solutions: make use of all available information.
- Few systems learn from experience.
- The remaining DIA problems require large contexts: figures, equations, tables, degraded documents.
- Until computers learn to organize information autonomously, such problems will require interaction.
- Interaction must not be wasted.

Thank you
